

Baum Whitepaper

v0.1 · Stable Company · Robinhood Chain

1. Summary

Baum is the agent inside Stable's lender portal. It reviews and verifies mortgage documents, moves loans through funding and onto the Stable Mortgage Registry, and keeps USDX — the stablecoin those loans back — liquid and on peg. It has run Stable's USDX vault for six months; the record is visible on Stable's earn page. Today it works for lenders and brokers. It is the part of Stable that already earns.

Baum runs on Stable's own agent harness, built to operate across TradFi and DeFi.

This paper is about opening Baum up.

The same agent that runs a lender's pipeline can run an individual's onchain account: hold tokens, provide liquidity, lend, borrow, trade, and vote, from a wallet the user owns, under limits the user sets. The BAUM token and the Baum Deed Deck — 3,888 playing cards, each a Broker with its own agent-bound wallet — are how that access is distributed, how the people who use it are rewarded, and how Baum funds its own growth from a mortgage-review tool into a network of agents operating capital across Robinhood Chain.

Every part of the design points at one outcome: more capital working in USDX, more of it operated by Baum, and the rewards going to the people who put it there.

What follows covers the BAUM token, the Deed Deck, the points and level system, the USDX lending market, the sub-DAO structure, and the launch schedule.

2. Tokens

Token	Role
BAUM	Agent economy token. Launches on Robinhood Chain, paired with USDX. Backs the Broker vault, gates Broker levels, and is the incentive token.
STABLE	Membership token. Burned to mint Brokers in the whitelist mint. Continues alongside BAUM.
USDX / mUSDX	Stable's mortgage-backed stablecoin and its yield-bearing wrapper. USDX is what the Broker network is built to distribute. Baum fees are paid in USDX.
Sub-DAO tokens	One per sub-DAO, launched on Baum's launchpad, paired only with USDX.

3. BAUM

Total supply: 1,000,000,000

Allocation	%	Notes
Liquidity	20%	Paired with USDX at TGE
Broker vault reserve	19.44%	194,400,000 BAUM — backs redemption of every Broker
Treasury	20.56%	LP-out ladder below
Ecosystem	20%	Growing the Baum network: rewards, programs, partners, integrations. Unlocked at TGE
Team & Stable Company	20%	12-month linear vest

BAUM allocation, % of 1,000,000,000 supply

3.1 Launch

BAUM launches on Robinhood Chain on September 23, 2026. At TGE, 20% of supply is paired with USDx to form the BAUM/USDx liquidity pool; the vault reserve, treasury, ecosystem, and team and Stable allocations above are minted to their respective addresses. The Ecosystem allocation is held in a labeled multisig and deployments are published.

3.2 Treasury LP-out ladder

The ladder is how Baum raises capital. There is no private round: the treasury converts up to 20% of supply to liquidity in fixed tranches as BAUM's fully diluted valuation reaches the bands below, so Baum's funding comes from the open market at prices everyone can see in advance. The first 15% is defined here; tranches are placed as one-sided liquidity across each band.

Treasury LP-out ladder, cumulative % of supply

FDV band	Tranche	Cumulative
\$2M – \$4M	1.00%	1.00%
\$5M – \$7M	1.00%	2.00%
\$8M – \$10M	1.00%	3.00%
\$12M – \$15M	1.00%	4.00%
\$18M – \$21M	1.00%	5.00%
\$25M – \$30M	1.00%	6.00%
\$30M – \$60M	3.00%, placed evenly (1% per \$10M)	9.00%
\$60M – \$100M	6.00%, placed evenly (1.5% per \$10M)	15.00%

The remaining 5.56% of treasury supply may be placed between \$100M and \$250M FDV at the treasury's discretion. Fully executed through \$100M, the ladder raises approximately \$6.9M at band midpoints, before LP

fees. Proceeds fund Baum operations, USDX/mUSDX liquidity, and USDX Loop capital.

3.3 Fee routing

Baum earns portal fees, LP fees, and USDX/mUSDX arbitrage. Fees are collected in USDX. Until twelve months of operating runway is banked, fees route 70% to operations and 30% to liquidity. After that: 10% operations, 20% buybacks, 70% to USDX/mUSDX liquidity, arbitrage, and USDX lending capital.

4. Baum Deed Deck

3,888 Brokers, collected as the Baum Deed Deck. Each Broker is a playing card and an ERC-721 with its own ERC-6551 token-bound wallet: a real onchain account that holds assets, executes transactions, and travels with the NFT when it is sold.

A Broker is the unit of participation in the Baum network. Its wallet is the account Baum operates on your behalf, the place your points are earned, and the address that receives sub-DAO allocations.

4.1 Mint

Whitelist mint. 100,000 STABLE per Broker, 50% burned and 50% to the STABLE treasury on receipt. Eligible wallets were those on the STABLE leaderboard with more than 100 points at announcement, or that held more than 10,000 STABLE on average over any 24-hour period in September. Commits opened September 10 and ran first come, first served, with no per-wallet limit, until September 16. Claims opened September 18.

Reserving in quantity in a single whitelist commit improved the roll and the wallet:

Brokers reserved in one commit	Odds of Uncommon or Rare	Stable Points boost on the wallet
1	base	—
3	+50%	+10%, permanent
5	+100%	+20%, permanent

Public mint. Brokers not reserved in the whitelist mint are minted publicly at 0.03 ETH each, from September 21 through October 21 on OpenSea (opensea.io/collection/baum-deed-deck). Collection contract on Robinhood Chain: 0x7816974ceebebc03bc9e71999f88a447bd1c7620. Unminted Brokers are minted this way rather than placed in the vault. Quantity boosts apply to the whitelist mint only.

Every Broker wallet is seeded at mint with 0.01 USDX, 0.01 mUSDX, and 1 BAUM.

4.2 Sub-DAO membership, traits and the Multiplier Attribute

Each Broker is assigned at claim, at random and with equal weight, to one of five sub-DAOs. Each sub-DAO is an asset class. Stocks is the first; the other four are named at reveal.

The Deed Deck is a full deck of cards: 52 standard cards and two jokers, each printed 72 times ($54 \times 72 = 3,888$). Cards come in four types: Title (aces, one house per suit), Block (2–10, the houses on that suit's street), People (jacks are brokers, queens are listing agents, kings are lenders) and Chaos (jokers). Each suit is a street: Hearts 19 Magnolia, Diamonds 1847 Palisades, Clubs 12 Ironwood, Spades 4400 Balboa. Every card carries Rank, Suit, Type, Paper, Wear and Stamp, plus traits for its type, and the Multiplier Attribute. The full trait list is at docs.baumai.xyz.

A Broker's rarity comes from its whole trait set, and a rare Broker's premium is what collectors pay for those traits.

The Multiplier Attribute is the one trait with a mechanical effect: it multiplies the points the Broker earns, and nothing else. It does not change reward weight, allocations, or governance. Base odds:

Multiplier Attribute	Share	Points multiplier
Common	~85%	×1.00
Uncommon	~12%	×1.25
Rare	~3%	×1.50

A lucky roll climbs the levels faster. Every Broker can reach Level 5. Art and traits are revealed the week of September 28.

4.3 Vault

The Broker vault holds the 194,400,000 BAUM reserve: exactly 50,000 BAUM for every Broker in the collection.

Redeem: send a Broker to the vault, receive 50,000 BAUM. Redemptions open 30 days after TGE.

Buy: pay 60,000 BAUM plus a 10% fee (66,000 BAUM total), receive a Broker at random from the vault.

Redemptions are paid from the reserve; the 60,000 BAUM of each vault purchase returns to it. The 10% fee is taken outside the reserve: 70% buys real-world assets that are distributed to activated Broker holders, and 30% goes to the Baum treasury. Cumulative RWAs distributed to Brokers is published from the first distribution.

Redeeming forfeits the Broker's wallet contents unless withdrawn first. Empty the wallet before sending a Broker to the vault.

4.4 Activation

A Broker must be activated to earn. Activation authorizes a Baum instance on the Broker's wallet and pays a one-time fee in BAUM:

Broker level	Activation fee
Level 1 – 2	50,000 BAUM
Level 3 – 5	100,000 BAUM

50% of every activation fee is burned; 50% goes to the Baum treasury. Activation clears whenever the Broker changes hands; the new owner must reactivate. The Broker's level and Multiplier Attribute do not clear — they belong to the NFT.

5. Baum Portal

The Portal is where a Broker goes to work. The owner funds the Broker's wallet with USDX, USDG, or ETH, selects the actions Baum should take, and a Baum instance tied to that wallet executes them.

Baum is in private beta. Beta opens to all Deed Deck holders the week of September 28.

Baum operates under a scoped authorization on the wallet: allowlisted contracts only (core pools, the lending market, the vault, locks, governance), a maximum slippage, and no outbound transfers except to the Broker's owner. The owner retains custody through the NFT. Instances sleep at zero balance and wake on deposit.

5.1 Actions at launch

1. Hold USDX in the Broker wallet
2. LP a core pool (USDX/USDG, mUSDX/USDX, BAUM/USDX, ETH/USDX)

3. Swap through USDX — BAUM, Stock Tokens, sub-DAO tokens, as a one-off, a DCA schedule, or a limit order
4. Lend USDG to the USDX lending market

LP in RWA pools, arbitrage, yield optimization across every asset in the wallet, borrowing USDG against USDX, perps, and sub-DAO products are added as they go live.

5.2 Yield beyond USDX

Baum's job in a Broker wallet is to earn. USDX is the base, not the boundary. As tokenized stocks, commodities and other real-world assets list on Robinhood Chain, Baum provides liquidity to their pools paired with USDX, and arbitrages between pools and venues when prices drift. The owner sets the assets and the limits; Baum finds the yield and moves the capital, every hour, without being asked.

The Robinhood account connection extends the same job off-chain. It is designed to be thoughtless: connect once through Robinhood's agentic trading tools, and the Baum instance already operating the Broker wallet acts in the brokerage account under the same limits, with no separate setup, strategy or configuration. One agent, one set of rules, both accounts.

5.3 Fees

Baum charges 15 bps on volume and a 20% markup on API spend for funded-wallet instances. Fees are charged in USDX. Both fall with Broker level (Section 6.2): the volume fee reaches 2 bps at Level 5; the API markup reaches zero at Level 5. No performance fee.

6. Points and levels

Points are earned by a Broker's wallet, computed several times per day, and published as a snapshot hash whenever an allocation is paid so holders can verify their share.

6.1 Earning

Action	Rate
USDG lent to the USDX market	3 pts per \$1 per day
LP in a core pool	1 pt per \$1 per day
USDX held	1 pt per \$10 per day
mUSDX held	1 pt per \$25 per day
USDX/USDG swap volume	1 pt per \$100
BAUM and sub-DAO pair volume	1 pt per \$60
Governance vote cast	1,000 pts
Daily cap, per Broker	30,000 pts

The daily cap is what shapes the ladder: it is reached by \$10,000 of USDG lent, \$30,000 of LP, or \$300,000 of USDX held. Capital beyond that earns nothing more on a single Broker; the way to earn more is more Brokers. The Multiplier Attribute (Section 4.2) is applied after the cap, so an Uncommon Broker can earn up to 37,500 per day and a Rare up to 45,000.

Swap points are counted net of fees paid. Governance points are awarded only for votes on proposals that reach the backing threshold (Section 8.2). Points decay approximately 3% per week when a Broker is idle.

6.2 Levels

Level	Reward weight	Volume fee	API markup	Requirement
1	1.0×	15 bps	20%	Mint
2	1.5×	12 bps	15%	1,000,000 pts
3	2.0×	9 bps	10%	3,000,000 pts
4	3.0×	5 bps	5%	6,500,000 pts + 100,000 BAUM locked
5	4.0×	2 bps	0	11,000,000 pts + 250,000 BAUM locked

Locked BAUM is a gate, not an accelerator: it does nothing below Level 4. Levels 4 and 5 hold only while the lock is maintained; unlocking drops the Broker to Level 3 with its points intact. Levels travel with the Broker on sale.

For reference: a Broker lending \$10,000 of USDG runs at the daily cap and reaches Level 5 in about a year (Level 2 in about five weeks, Level 3 in about three months, Level 4 in about seven months). A Rare Broker on the same capital reaches Level 5 in about eight months. \$10,000 of LP reaches Level 3 in about ten months.

6.3 Sunset rule

Activation fees and level locks halve automatically and permanently at three FDV thresholds:

	Launch	At \$25M FDV	At \$75M FDV	At \$225M FDV
Activation, L1–2	50,000 BAUM	25,000	12,500	6,250
Activation, L3–5	100,000 BAUM	50,000	25,000	12,500
Level 4 lock	100,000 BAUM	50,000	25,000	12,500
Level 5 lock	250,000 BAUM	125,000	62,500	31,250

7. USDX lending market

A single Morpho-style market on Robinhood Chain, network-wide: USDX collateral, USDG loans, standard utilization-kinked interest rate. Borrowed USDG mints USDX, so lending capital flows into USDX reserves and the USDX supply grows with the market.

Lenders earn three ways:

1. Market interest from borrowers
2. BAUM incentives on lent USDG, at a rate set when the market opens
3. Broker points at the highest rate in the system

Initial targets: \$20M USDG lent, \$20M USDX supply.

8. Sub-DAOs

Each of the five sub-DAOs launches its own token on the Baum launchpad. Sub-DAO tokens pair only with USDX.

8.1 Token allocation (per sub-DAO)

Allocation	%
LP / USDX	40%
Baum treasury	20%
Brokers of that sub-DAO	20%
Brokers of all sub-DAOs	10%
That sub-DAO's treasury	10%

Both Broker allocations stream over 12 months, recomputed each epoch by reward weight and votes cast. The 10% cross-sub-DAO slice is weighted by reward weight and governance participation across the network. The Multiplier Attribute plays no part in either.

Each sub-DAO's LP bucket follows the same LP-out ladder as BAUM (Section 3.2), funding its treasury as the token grows. The remaining 25% stays as standing USDX liquidity.

8.2 Governance and revenue

Brokers govern their sub-DAO's treasury from that sub-DAO's launch. A proposal requires backing from 1% of the sub-DAO's token to be submitted and 10% to go to a vote; it passes with 60% of votes cast. These thresholds are adjustable by vote.

Sub-DAOs are expected to operate revenue-generating products over time; details follow each sub-DAO's launch. Revenue from sub-DAO products is split:

Recipient	%
That sub-DAO's treasury	33%
Baum treasury	33%
Stable Company	23%
Other sub-DAO treasuries	10%
Charity	1%

The charity share is routed onchain and split 50% to Project S.A.V.E. (New Orleans — free emergency legal representation for domestic violence survivors) and 50% to EverHope (Bentonville, Arkansas — emergency shelter and care for children in crisis).

8.3 Launch order

Stocks launches first, in October. The second sub-DAO follows four to six weeks later, then one every four to six weeks.

9. Schedule

When (2026)	Event
September 10	Whitelist commit window opened
September 16	Whitelist commit window closed
September 18	Whitelist claims opened
September 21	Public mint opened

When (2026)	Event
September 23	BAUM TGE on Robinhood Chain
Now	Baum in private beta
Week of September 28	Art and trait reveal. Baum beta opens to all Deed Deck holders
October	DEX and launchpad live. Stocks sub-DAO TGE, first allocation stream, governance opens
October 21	Public mint closes
30 days after TGE	Vault redemptions open
4 – 6 weeks after Stocks	Second sub-DAO
Every 4 – 6 weeks	Remaining sub-DAOs

10. Contracts and links

Contract addresses for BAUM, the Broker collection, the vault, locks, the lending market, and the launchpad are published at launch and listed at baumai.xyz.

Baum Deed Deck (Robinhood Chain): 0x7816974ceebebc03bc9e71999f88a447bd1c7620

Collection: opensea.io/collection/baum-deed-deck · X: [@trybaum](https://twitter.com/trybaum)

Broker points and sub-DAO allocations are program rewards for network participation. Nothing in this document is financial advice.
